	Open -- unanswered
	Partial -- some information gathered
	Answered -- resolved

Total: 34 | Open: 24 | Partial: 5 | Answered: 5

1. Detection & immediate effects

1. What happens when a report is dismissed? Is the user notified? Do they remain on their new account with no further action? [PARTIAL ANSWER: The NotMyAccount path shows "you'll hear back within 1-2 business days" -- implies notification. For MergeRequested dismissal, still unclear what the user sees.]
2. Can the user dismiss or navigate away from the "Account conflict detected" banner, or is it truly persistent until resolved? [ANSWER: banner stays until resolved.]
3. What validation is applied to the email and phone number inputs? Must they match the existing account exactly? [ANSWER: Yes -- validated via validate-email and validate-phone endpoints. Match is required. Inline error shown on mismatch. User cannot proceed until both match.]
4. What does the user see during the waiting period (between report submission and admin decision)? Just progress notifications, or is there a status screen? [ANSWER: The tile becomes status-aware. MergeRequested -> "Your identity is being verified" (tappable, reopens to confirmation screen). NotMyAccount -> "Your report is under review" (not tappable).]
5. If the user is set to KYCStatus = 1 after approval, what happens to their new (duplicate) account? Is it archived/merged/deleted? [ANSWER: The saga shows the "loser" account's identity is suspended, Cosmos data is relinked, phone is migrated, and KYC is restored on the surviving account. The loser is effectively deactivated/relinked, not deleted.] Follow-up confirmation: Is this correct -- the loser is deactivated/relinked, not deleted? (partial -- winner selection confirmed, full constraint list unclear)
6. Can a user submit multiple conflict reports if they abandon the flow partway through?
7. The flow assumes the user wants to keep the duplicate (new) account -- they're put back into KYC on that account. What if the user wants to keep their original account instead? Is there a path for that, or is the only option to recover into the new account? [ANSWER: The maker selects the "winner" during the merge flow -- so either account can be chosen as the surviving one. The other becomes the "loser" and is suspended/relinked.] Follow-up: Are there any restrictions on which account can be selected as winner beyond error 1005 (winner has wallet/history)?
8. Account takeover risk: If someone obtains a user's TRN (e.g. via a stolen ID document), they could create a new account, trigger duplicate detection, and claim ownership of the original account by entering the original's email/phone (?). What security measures prevent this? Specifically: is a verification email/SMS sent to the original account's email/phone to confirm the merge, or does the flow rely solely on the admin maker/checker review to catch fraudulent claims? [PARTIAL ANSWER: Multiple mitigations confirmed: (a) email and phone must match exactly via validation endpoints, (b) step-up re-authentication required before submission, (c) existing account holder gets a passive "Account under review" notification tile, (d) two-person maker/checker rule on admin side. However, the existing holder cannot actively block or contest -- their notice is informational only ("Got it" button).]

9. When a duplicate is detected for the "new" account, does this have any effect on the existing one ? Is any state change applied to the existing account at detection time? Can the existing one still use the application as normal? [PARTIAL ANSWER: Confirmed the Existing account holder gets a passive notice only -- "Account under review" tile with a "Got it" button, no data entry, no decision, no recover option. This implies no blocking state change at detection time. Still unclear: does the Existing account's kycStatus change, and are they blocked from any KYC-gated features or can they continue using the app fully?]

2. KYC status & state transitions

10. TRN_DUPLICATED is confirmed as a kycStatus value. After merge approval, the user is set to kycStatus = 1. What are all valid transitions in and out of TRN_DUPLICATED? Are there illegal transitions that need guarding -- e.g. can a user bypass the resolution flow and reach fully verified directly? [PARTIAL ANSWER: Transition map still not fully documented.]
11. Is TRN the only matching criterion for duplicate detection? For markets that don't use TRNs, is there an equivalent identifier per market -- or is this feature JM-only?
12. What if the Existing account has KycStatus = 5 (rejected)? Can duplicate detection still be triggered on the new account, or does the conflict detection check the existing account's KYC status before firing?

3. Rejection, NotMyAccount, and existing account outcomes

13. Checker rejection -- full outcome: When a checker rejects a merge: (a) Is the Target user notified and what is communicated if yes? (b) Does the Home tile revert to "Account conflict detected" or stay as "Your identity is being verified"? (c) Can the user re-initiate the report flow, or must they wait for admin? (d) Does kycStatus remain TRN_DUPLICATED or change? How does the rejected merge play out and affect both the Target and the Existing account?
14. NotMyAccount admin handling and customer outcome: When a customer reports "No, this is not me" -- (a) What does the admin do with it -- separate workflow, or dismiss/archive? (b) Can the Target user continue using the app while under review? (c) Does kycStatus remain TRN_DUPLICATED or transition? (d) Does the Existing account change state or stay unaffected?
15. Existing user experience through merge completion: If the Existing account ends up as the "loser," do they get any advance warning before sessions are kicked and the account is suspended? They only ever saw a passive "Account under review" tile with a "Got it" button -- no decision, no action.

4. Saga, rollback, and failure

16. Saga rollback customer experience: If the merge saga fails and rolls back -- what does the customer see? Are they notified? Does the tile state change? Does the conflict revert to a previous tab on the admin side?
17. Report submission failure (customer side): What happens when the reportConflict call itself fails (network error, server error, timeout) after the user has passed validation and step-up auth? Does the user stay on the submit screen with a retry option? Is any partial state saved (e.g. validated email/phone), or must they re-enter everything? Does the tile state change, or remain at "Account conflict detected"? What about step-up re-authentication failure specifically -- does the user need to restart the entire flow or just re-authenticate?

5. Admin actions (non-merge)

18. Archive action: What does "archive" actually mean in this context? Is there an archive saga? What does the customer on the archived account experience? Can it be reversed? Does archiving the loser resolve the duplicate/conflict situation (i.e. remove the TRN_DUPLICATED state from the remaining account and clear the conflict from the admin panel)?
19. Suspend action: What does suspend mean in this context -- is it temporary? How and when is it lifted? What can/can't the user do while suspended?
20. Reset KYC action: When is Reset KYC used instead of merge/archive/suspend? What does it do to the affected account(s) to potentially resolve a conflict/duplicate situation?

21. Session invalidation as standalone action: The maker can invalidate a user's session independently of the merge saga. When/why would this be used on its own? What does the user experience -- force logout, error message?

6. Pre-flight checks & merge blockers

22. Beyond error 1005, what else does the pre-flight check validate? Is 1005 triggered by wallet OR history (either one), or wallet AND history (both)? What other error codes exist and what are their remediation paths?
23. Error 1005 blocks merge when the winner has wallet/history. What about when the loser has a prepaid card or balance -- is it migrated, does the card need closing first, or is the merge blocked?
24. Can the maker select data from each account individually (e.g. email from one, phone from the other), or is it strictly winner takes all?
25. What are all the reasons a merge would not be allowed? We only know error 1005. Are there others -- pending transactions, active loans, sanctions flags, existing merge in progress, etc.?

7. Edge cases & security

26. 3+ accounts with same TRN: The flow assumes two accounts (Target vs Existing). What happens if three or more accounts share the same TRN -- separate conflicts per pair, or group handling?
27. Race conditions: What happens if both the Target and Existing users file reports simultaneously? Or if the Existing user deletes their account while a merge is under review? Or if two makers propose conflicting actions on the same conflict? [PARTIAL ANSWER this duplicate flow seems to be able to trigger when a new account looks like an existing one, if only the new account can potentially trigger (waiting for a final answer on what happens to the existing account when a duplicate is detected) then this couldn't happen.]
28. Deep-link security: Can the /merge-request or /not-my-account deep links be crafted or intercepted to bypass onboarding steps for a different user's conflict?

8. Release & migration

29. Pre-existing conflicts at release: What happens to users already in this duplicate/conflict state who have not yet been resolved by the time this feature goes live? Will resolution be purely an admin function for those legacy cases (i.e. no customer-initiated recovery flow available to them), or will they retroactively see the new Home tile and onboarding flow? What is their experience -- do they get a notification, does the tile appear on next app launch, or must admin act first?

9. State machine gaps

30. Conflict status in "New" tab: Is there an explicit status field on the conflict record when it's in the New tab (e.g. OPEN, UNASSIGNED), or is it purely implied by the absence of an associated operation?
31. Resubmit after rejection -- tab behaviour: When a maker resubmits after rejection, the conflict is already in Finished. Does it move back to "Waiting for Approval" with the new operation, or does a new operation exist on a conflict that remains in Finished until approved?
32. Processing state between report and admin visibility: Is there any intermediary state between the customer submitting a report and the conflict appearing in the admin New tab? (e.g. a queue, async processing delay, or webhook confirmation step)
33. Non-merge action state machines: Do archive, suspend, and reset KYC follow the same PENDING -> APPROVED/REJECTED -> saga pattern as merge? Do they have their own saga stages? What are their operation type identifiers?
34. Existing account tile after resolution: After a merge completes (or is rejected/archived), what happens to the Existing account's "Account under review" tile? Does it disappear, change text, or persist?
