

GKOne UAT Test Data - gkone-customer-support API

uat-pull-2026-09-24 · test-data-summary.md

This is the test data reference for the third-party team building an integration that answers user inquiries about GKOne users and transactions. Each customer below lists what you can look them up by, what their transaction history contains, and - where relevant - what an MTCN validation call against their transfers should return.

Everything here comes from a single pull of GKOne's UAT environment. It's synthetic or masked test data - none of it represents a real customer or real financial activity - but it behaves like the real thing, including a couple of genuinely-observed failure cases (see the [MTCN validation reference](#)) rather than invented ones. UAT is refreshed periodically, so treat the specific IDs and MTCNs below as valid for this pull rather than permanent.

Tags

SYNTHETIC a fabricated value, not tied to any real transaction or user

Endpoints in Scope

```
POST    /api/v1/customers/filter
POST    /api/v1/users/{userId}/transactions/filter
GET     /api/v1/users/{userId}/transactions/{transactionId}
POST    /api/v1/remittances/{mtcn}/validation
PATCH  /api/v1/remittances/{mtcn}/receiver/name
```

Important: a valid, well-formed request to the PATCH endpoint above currently returns **501 Not Implemented**. This is expected, documented behavior - please don't log it as a defect.

How to read this

- **LOOKUP TYPES** - `/customers/filter` and `/remittances/{mtcn}/validation` both take one identifier per request: `GKO_NUMBER`, `TRN`, `ID_DOCUMENT`, or `EMAIL`. Each customer below lists which of these it actually has a value for, and what that value is. Don't try a lookup type marked "not available" - it'll just return empty. More details are included in the accompanying documentation.
 - **STATUSES / PRODUCT TYPES** - `/users/{userId}/Transactions/Filter` lets you filter by `statuses` and `productTypes`. Each customer below lists the exact values their own transaction history contains, so you can build a filter test that's guaranteed to return something (or, by using a value they *don't* have, guaranteed to return nothing).
 - **MTCNS** - where a customer's transactions include a settled Western Union transfer, its MTCN is listed. See the [MTCN validation reference](#) at the end for expected outcomes.

MTCN Validation Reference

MTCN	SENDER	RECEIVER	EXPECTED OUTCOME	NOTES
3524056646	Danny Phantom	Dane Tester	already paid	Outbound + inbound legs both settled - fully paid out.
8454322287	Nicoreen Test	Naomi Benjamin	already paid	Outbound + inbound legs both settled - fully paid out.
8553916423	May Banks	Naomi Benjamin	valid / not yet collected	Outbound settled, no inbound record in this pull - collectible for at least the next 30 days.
4773916423	May Banks	Dane Tester	valid / not yet collected	Outbound settled, no inbound record in this pull - collectible for at least the next 30 days.
0123243471	Jaelynn Watt	Red McRaith (external - no GKOne profile)	valid / not yet collected	Outbound settled; recipient isn't a GKOne customer, so no inbound leg exists in our data by design.
1160897583	Jaelynn Watt	Christopher Witherspoon (external - no GKOne profile)	valid / not yet collected	Outbound settled; recipient isn't a GKOne customer, so no inbound leg exists in our data by design.
7042358185	N/A	Naomi Benjamin	invalid format (422 "MTCN INVALID")	Real observed failure - an actual inbound validation attempt against this MTCN returned WU code U0102 (MTCN INVALID). Sender identity wasn't captured in this record. Unlike the synthetic rows below, this shows a normal-looking 10-digit MTCN can still be rejected as invalid by WU.
0221925872	N/A	N/A	SYNTHETIC receiver name mismatch (422)	Doesn't belong to any test user in this package. Validate it against any test user's identity to deliberately draw a receiver-name-mismatch error.
0000000000	N/A	N/A	SYNTHETIC invalid format (422 "MTCN INVALID")	Not tied to any real transaction - use for format-validation testing.
0000000001	N/A	N/A	SYNTHETIC not found	Well-formed but unknown - use for a clean "unknown MTCN" negative case.

Caution: if you validate the same MTCN twice within a 15-minute window, expect the second call to come back `record locked to another terminal`, regardless of what the first call returned (mismatch or otherwise). Avoid repeat validation calls against the same MTCN within that window.
