User Profile Sync

App journey test cases · draft 02 · 22 Oct 2026

21 active cases | 4 deferred | Happy path: 1 | Alternate path: 11 | Negative: 2 | Edge case: 5 | Known issue / flag: 2

What this pack covers

What happens to the **remittance** and **wallet** copies of a customer's profile as a customer or admin moves through the app and admin portal. You check results in the app and by **reading** the Cosmos containers. Nothing here needs you to publish messages, edit databases or flush the cache; those cases live in the separate manual-messaging pack.

How to use it

1. **Check the flags**
   Make sure the QA flags below are set, especially remittance event sync.
2. **Do the steps**
   Follow each case top to bottom. Tick the box when the expected result matches.
3. **Wait for sync**
   When a step says *allow propagation*, wait up to 1 minute before checking.
4. **Record the result**
   Mark Pass, Fail or Blocked at the bottom of each card, with notes.

Flags in QA

Flag	QA value	What it means for you
`EnableProfileChangeOutboxDispatch` (IAM)	**true**	`UserProfileChanged` is published
`WalletUserProfileEventSyncEnabled` (wallet)	**true**	Wallet applies events. Read once at startup
`EnableRemittanceUserProfileEventSync` (remittance)	**false**	**Remittance doesn't read its subscription in QA.** Turn it on before the remittance-snapshot checks (it's re-read every minute, so no redeploy). Otherwise run those checks in Dev
`EnablePhoneNumberProfileMigration` (IAM)	[confirm]	Needed for a phone change to publish (TC 24, deferred)
`EnableIdentityConflictResolution` (IAM)	[confirm]; off in UAT	Needed for merge or conflict resolution to publish (TC 21)

Before you start (applies to every case)

- QA environment, with the flags above.
- Read access to `RemittanceUserProfiles` (Remittances DB, partition key `/userId`), wallet `UserProfiles` (partition key `/UserId`), and the User Profile IAM record.
- **Propagation:** IAM sweeps the outbox every 10 seconds. "Allow propagation" means waiting up to 1 minute before querying a snapshot.
- Remittance fields are camelCase; wallet fields are PascalCase.

At a glance

A quick checklist of every case. Tick as you go.

TC	What you're checking	Type	Pass	Fail
1	A remittance snapshot is created from the User Profile service the first time an existing customer starts an outbound remittance	Happy path	☐	☐
2	An admin change to a customer's name and date of birth reaches both profile copies	Alternate path	☐	☐
3	Whether an admin change to mother's maiden name reaches the remittance snapshot	Alternate path	☐	☐
4	An admin TRN change updates the TRN on both profile copies	Alternate path	☐	☐
5	An admin save with no actual changes publishes nothing and leaves both profile copies untouched	Alternate path	☐	☐
6	A primary address change replaces the address on both profile copies	Alternate path	☐	☐
7	An occupational level change updates the remittance snapshot only when the value actually changes	Alternate path	☐	☐
8	Completing eKYC brings both profile copies to Tier 1, including prepaid card data for JM	Alternate path	☐	☐
9	An address change in CMS reaches both profile copies when the customer next signs in	Alternate path	☐	☐
10	An existing customer's KYC becomes TRN_DUPLICATED on their profile copies when another customer with the same TRN passes Ondato	Alternate path	☐	☐
11	A credit card application update carries the address and occupation to the remittance snapshot	Alternate path	☐	☐
12	A prepaid card replacement updates the masked card details on the wallet profile	Alternate path	☐	☐
13	A customer whose KYC was reset by an admin can't complete a remittance, and that both copies show the reset	Negative	☐	☐
14	The eligibility check uses the current KYC status when the customer's profile is cached mid-flow	Negative	☐	☐
15	A remittance started straight after a profile change uses the updated details	Edge case	☐	☐
16	Inbound and outbound participant fields match the pre-feature baseline for the same customer	Edge case	☐	☐
17	A P2P transfer between two Tier 1 customers succeeds and leaves each with one remittance snapshot	Edge case	☐	☐
18	A new sign-up publishes no profile event and creates no profile copies until the customer is first read	Edge case	☐	☐
19	An account-deletion request publishes no event and leaves both profile copies in place	Edge case	☐	☐
20	The wallet profile's KYC status is not updated after a proof-of-funds upload (known issue)	Known issue / flag	☐	☐
21	What reaches the profile copies after an admin account merge, depending on the identity-conflict flag	Known issue / flag	☐	☐
22	An OTP-verified email change in the app is reflected in the remittance and wallet snapshots	Deferred	☐	☐
23	A remittance sent after an email change sends its confirmation to the new address only	Deferred	☐	☐
24	An OTP-verified phone number change updates the existing profile copies without creating a second record	Deferred	☐	☐
25	A Reset KYC that is proposed but not approved doesn't change either profile copy	Deferred	☐	☐

Happy path

TC 1 Verify that a remittance snapshot is created from the User Profile service the first time an existing customer starts an outbound remittance

Happy path | Remittances | User Profile Sync | Mobile | Regression

Before you start

- The customer is KYC Tier 1 and eligible to send a WU Outbound remittance
- The customer has no document in `RemittanceUserProfiles`

#	Do this	You should see	✓
1	Query `RemittanceUserProfiles` for the customer's `userId`	No document is returned	☐
2	Log in to the app as the customer, start a WU Outbound remittance and request a quote	The quote is displayed	☐
3	Complete the recipient details and proceed to confirmation	The confirmation screen shows the customer's correct details	☐
4	Confirm and complete payment	The transaction completes	☐
5	Query `RemittanceUserProfiles` again	One document exists, with `id` = `userId`	☐
6	Compare the snapshot with the customer's User Profile record (name, email, phone, DOB, address, KYC status, ID document, eligibility flags, GKO number, birth country, employment info)	Every stored field matches User Profile	☐

Afterwards

- The customer has exactly one remittance snapshot

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

Alternate valid paths

TC 2 Verify that an admin change to a customer's name and date of birth reaches both profile copies

Alternate path | Remittances | Wallet | User Profile Sync | Admin Portal

Before you start

- The customer has existing remittance and wallet profile documents
- Admin access to the user-details edit (`PATCH` on `UpdateUserDetails`)
- `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Record the names and date of birth on both documents	—	☐
2	In the admin portal, change the customer's last name and date of birth and save (approving it if required)	The change is saved	☐
3	Allow propagation, then query the remittance snapshot	`lastName` and `dateOfBirth` show the new values; other fields are unchanged	☐
4	Query the wallet profile	`LastName` and `Birthdate` show the new values	☐

Afterwards

- The published event had `changeSource` = `AdminUserDetailsPatch` , and `changedFields` listed only the two changed fields (check if you can see the topic)

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 3 Verify whether an admin change to mother's maiden name reaches the remittance snapshot

Alternate path | Remittances | User Profile Sync | Admin Portal | Compliance

Before you start

- The customer has an existing remittance snapshot with `mothersMaidenName` filled in
- `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Record `mothersMaidenName` on the remittance snapshot	—	☐
2	In the admin portal, change only the mother's maiden name and save	The change is saved; User Profile shows the new value	☐
3	Allow propagation, then query the remittance snapshot	**Expected per the review:** `mothersMaidenName` is **unchanged**. The event lists `motherName` in `changedFields` , but the `profile` payload has no property for it, so remittance can't apply it	☐

#	Do this	You should see	✓
4	Start a WU Outbound remittance and complete customer profile validation	The forced refresh fetches the profile from the API. Record whether `mothersMaidenName` on the snapshot now matches User Profile	☐

Afterwards

- If step 3 shows the old value, raise it as a defect candidate: the snapshot holds a stale compliance field until the next forced refresh

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 4 Verify that an admin TRN change updates the TRN on both profile copies

Alternate path | Remittances | Wallet | User Profile Sync | Admin Portal | Compliance

Before you start

- The customer has existing profile documents; a valid TRN not used by any other customer is available
- `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Record every field on the remittance snapshot	—	☐
2	In the admin portal, change only the TRN and save	The change is saved	☐
3	Allow propagation, then query both documents	`trn` / `Trn` show the new value; other profile fields are unchanged	☐
4	Note `isTaxIdentificationNumberValidated` on the remittance snapshot	Record the result (it's taken from the event's eligibility block)	☐

Afterwards

- The new TRN is on User Profile and both copies

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 5 Verify that an admin save with no actual changes publishes nothing and leaves both profile copies untouched

Alternate path | Remittances | Wallet | User Profile Sync | Admin Portal

Before you start

- The customer has existing profile documents

#	Do this	You should see	✓
1	Record the sync metadata on both documents	—	☐
2	In the admin portal, open the customer's details and save without changing anything	The save succeeds	☐
3	Allow propagation, then query both documents	The sync metadata is unchanged (an empty field set records nothing)	☐

Afterwards

- No profile data changed

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 6 Verify that a primary address change replaces the address on both profile copies

Alternate path | Remittances | Wallet | User Profile Sync | Mobile

Before you start

- The customer has existing profile documents
- `EnableRemittanceUserProfileEventSync` is on
- The app's address update calls `POST /user/primaryAddress` *(confirm the screen)*

#	Do this	You should see	✓
1	Record the address on both documents, and `hasValidProofOfAddress` on the remittance snapshot	—	☐
2	Change the primary address so every line is different	The change is saved	☐
3	Allow propagation, then query the remittance snapshot	Every address field matches the new address, with nothing left over from the old one	☐
4	Query the wallet profile	`Address.city`, `country` and `parish` match	☐
5	Check `hasValidProofOfAddress` on the remittance snapshot	Record the result *(the review says remittance keeps its stored proof-of-address validity on events)*	☐

Afterwards

- Both copies match User Profile's primary address

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 7 Verify that an occupational level change updates the remittance snapshot only when the value actually changes

Alternate path | Remittances | User Profile Sync | Mobile

Before you start

- The customer has an existing remittance snapshot
- `EnableRemittanceUserProfileEventSync` is on
- Occupational level can be changed through the app or support (`PUT api/Users/UpdateOccupationalLevel`)

#	Do this	You should see	✓
1	Record `employmentInfo` and `syncInfo` on the remittance snapshot	—	☐
2	Change the occupational level to a different valid value	The change is saved	☐
3	Allow propagation, then query the remittance snapshot	`employmentInfo.occupationalLevel` shows the new value; other employment details are unchanged	☐
4	Query the wallet profile	Unchanged (wallet ignores occupational level)	☐
5	Submit the same occupational level again	The save succeeds	☐
6	Allow propagation, then query the remittance snapshot	`syncInfo` is unchanged (no event when the value didn't change)	☐

Afterwards

- The occupational level matches User Profile

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 8 Verify that completing eKYC brings both profile copies to Tier 1, including prepaid card data for JM

Alternate path | Remittances | Wallet | User Profile Sync | KYC | Onboarding | Mobile

Before you start

- A newly registered customer with KYC status `NOT_COMPLETED`
- `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Complete eKYC in the app (Ondato verification, then the completion screen; for JM, choose a pick-up location for the card)	Onboarding completes	☐
2	Query the User Profile record	`KycStatus` = `TIER_1` ; for JM, prepaid card info is present	☐
3	Allow propagation, then query the wallet profile	`KycStatus` / `KycTier` reflect Tier 1; for JM, the card data is present with a masked card number (first 6 and last 4 digits only)	☐

#	Do this	You should see	✓
4	Query the remittance snapshot (or start a remittance to create it)	`kycStatus` = `TIER_1`; `address`, `trn` and `externalWalletReferenceNo` match User Profile	☐
5	Start a WU Outbound remittance	The customer passes customer profile validation	☐

Afterwards

- Both copies agree with User Profile. *(KYC completion publishes both* `UserProfileChanged` *(* `KycCompletion` *) and* `UserProfileUpdated` *; remittance receives both.)*

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 9 Verify that an address change in CMS reaches both profile copies when the customer next signs in

Alternate path | Remittances | Wallet | User Profile Sync | CMS | Mobile

Before you start

- The customer's address in CMS has been changed so it differs from User Profile
- Both profile documents exist; `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Record the address on both documents	—	☐
2	Sign in to the app as the customer	Sign-in succeeds	☐
3	Query User Profile	The address matches CMS	☐
4	Allow propagation, then query both documents	Both show the CMS address	☐

Afterwards

- The published event had `changeSource` = `CmsAddressSync`

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 10 Verify that an existing customer's KYC becomes TRN_DUPLICATED on their profile copies when another customer with the same TRN passes Ondato

Alternate path | Remittances | Wallet | User Profile Sync | KYC | Onboarding | Compliance

Before you start

- Customer A is Tier 1 with profile documents in both containers
- Customer B is new and will pass Ondato with the same TRN as customer A
- `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Complete Ondato verification for customer B	Ondato approves customer B	☐
2	Query customer A's User Profile record	`KycStatus` = `TRN_DUPLICATED`	☐
3	Allow propagation, then query customer A's remittance and wallet documents	Both show `TRN_DUPLICATED`	☐
4	As customer A, attempt a WU Outbound remittance	Blocked at customer profile validation	☐

Afterwards

- The published event for customer A had `changeSource` = `OndatoIdentityVerification` and `changedFields` = `kycStatus`

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 11 Verify that a credit card application update carries the address and occupation to the remittance snapshot

Alternate path | Remittances | Wallet | User Profile Sync | Credit Card

Before you start

- The customer has existing profile documents; `EnableRemittanceUserProfileEventSync` is on
- A credit card application can be submitted for the customer (`POST api/Kyc/UpdateFromCreditCardApplication`) *(confirm the entry point)*

#	Do this	You should see	✓
1	Record the address, occupation and employment details on the remittance snapshot	—	☐
2	Submit a credit card application with a different address, occupation, employment status and mother's maiden name	The application is accepted; User Profile is updated	☐
3	Allow propagation, then query the remittance snapshot	`address` and occupation show the new values. Employment status and `mothersMaidenName` are expected to stay the same, because those fields aren't in the event payload	☐
4	Query the wallet profile	The address is updated	☐

Afterwards
- Record any fields User Profile changed that neither copy received

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 12 Verify that a prepaid card replacement updates the masked card details on the wallet profile

Alternate path | Wallet | Prepaid Card | User Profile Sync | Mobile

Before you start
- A JM customer with an active prepaid card and a wallet profile
- `PrepaidCardReplacementRequestsEnabled` is on in QA

#	Do this	You should see	✓
1	Record the prepaid card info on the wallet profile	—	☐
2	Request a replacement card in the app	The request succeeds	☐
3	Allow propagation, then query the wallet profile	The card info shows the new card; the masked number shows only the first 6 and last 4 digits; no full card number	☐

Afterwards
- The wallet profile and User Profile agree on the active card

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

Negative / error cases

TC 13 Verify that a customer whose KYC was reset by an admin can't complete a remittance, and that both copies show the reset

Negative | Remittances | Wallet | User Profile Sync | KYC | Admin Portal | Compliance

Before you start

- The customer is Tier 1 in User Profile and both copies
- Admin maker and checker access; `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Propose a Reset KYC action for the customer, and approve it as checker	The customer's KYC status in User Profile is reset	☐
2	Immediately attempt a WU Outbound remittance as the customer	Blocked at customer profile validation (the forced refresh)	☐
3	Allow propagation, then query both copies	Both show the reset KYC status; note whether wallet `KycTier` was also cleared	☐

Afterwards

- No remittance was created

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 14 Verify that the eligibility check uses the current KYC status when the customer's profile is cached mid-flow

Negative | Remittances | User Profile Sync | KYC | Compliance

Before you start

- The customer is Tier 1 and starts a remittance (so the profile is cached)

#	Do this	You should see	✓
1	As the customer, open WU Outbound and get a quote	The quote is shown	☐
2	In the admin portal, reset the customer's KYC and approve it	The reset is approved	☐
3	Continue to confirmation and submit	Blocked at customer profile validation; no payment is taken	☐

Afterwards

- This doesn't depend on remittance event sync, because the forced refresh reads User Profile directly

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

Edge cases

TC 15 Verify that a remittance started straight after a profile change uses the updated details

Edge case | Remittances | User Profile Sync | Mobile

Before you start

- The customer's profile is cached (they used remittances within the last 30 minutes)
- `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Change the customer's primary address	The change is saved	☐
2	After about 30 seconds, start a WU Outbound remittance and go to confirmation	The new address is shown (the event cleared the cached entry)	☐

Afterwards

- No transaction after the change holds the old address

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 16 Verify that inbound and outbound participant fields match the pre-feature baseline for the same customer

Edge case | Remittances | User Profile Sync | Regression

Before you start

- A baseline of inbound and outbound participant fields for the customer, captured before profile sync was deployed
- The customer's profile hasn't changed since then

#	Do this	You should see	✓
1	Send a WU Outbound remittance and compare every sender participant field with the baseline	Every field matches exactly	☐
2	Process an inbound remittance and compare every receiver participant field	Every field matches exactly	☐

Afterwards

- Moving to the shared resolver changed no participant field

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 17 Verify that a P2P transfer between two Tier 1 customers succeeds and leaves each with one remittance snapshot

Edge case | Remittances | P2P | User Profile Sync | Mobile

Before you start
- Two Tier 1 customers with valid prepaid cards

#	Do this	You should see	✓
1	Complete a P2P transfer from the sender to the receiver	The transfer completes	☐
2	Query `RemittanceUserProfiles` for both customers	At most one snapshot each, matching User Profile *(still open: whether the receiver goes through the resolver)*	☐

Afterwards
- No duplicate snapshots

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 18 Verify that a new sign-up publishes no profile event and creates no profile copies until the customer is first read

Edge case | Remittances | Wallet | User Profile Sync | Onboarding

Before you start
- A new email address and phone number for registration

#	Do this	You should see	✓
1	Register a new customer in the app (sign-up only, no eKYC)	Registration succeeds	☐
2	Wait 1 minute, then query both containers for the new user ID	No remittance snapshot; wallet profile [record the result] (sign-up is a deliberate non-publisher)	☐

Afterwards
- The customer's copies only appear on their first read or first published change

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 19 Verify that an account-deletion request publishes no event and leaves both profile copies in place

Edge case | Remittances | Wallet | User Profile Sync | Data Retention

Before you start

- A customer with both profile copies who can request account deletion in the app

#	Do this	You should see	✓
1	Request account deletion in the app	The request is accepted	☐
2	Wait 1 minute, then query both containers	Both copies still exist, unchanged (account-deletion requests are a deliberate non-publisher)	☐

Afterwards

- Record the result for the open question on PII retention in the copies

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

Known-issue and flag-dependent checks

TC 20 Verify that the wallet profile's KYC status is not updated after a proof-of-funds upload (known issue)

Known issue / flag | Wallet | User Profile Sync | KYC | Known Issue

Before you start
- A customer for whom uploading proof of funds changes their KYC status

#	Do this	You should see	✓
1	Record `KycStatus` on the wallet profile	—	☐
2	Upload proof of funds until User Profile's KYC status changes	User Profile shows the new status	☐
3	Allow propagation, then query the wallet profile	Known issue: still the old status (`FundsService` isn't a publish point). If it has updated, update `known-issues.md`	☐

Afterwards
- The result is recorded against the known issue

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 21 Verify what reaches the profile copies after an admin account merge, depending on the identity-conflict flag

Known issue / flag | Remittances | Wallet | User Profile Sync | Customer Account Management | Known Issue

Before you start
- Two duplicate accounts set up for a merge; both have profile copies
- Note the QA value of `EnableIdentityConflictResolution`

#	Do this	You should see	✓
1	Record both accounts' copies	—	☐
2	Propose and approve the merge	The merge completes	☐
3	Allow propagation, then query both containers	**Flag on:** the copies reflect the merge (`IdentityConflictResolution`). **Flag off:** no event; the copies are unchanged	☐

Afterwards
- *(The IAM CR lists `MergeOrchestrator` as an uncovered writer. Record which path the merge actually took.)*

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

Deferred

Marked `[DEFER]` in draft 01 (2026-10-22). Kept here so they can be picked up later.

TC 22 Verify that an OTP-verified email change in the app is reflected in the remittance and wallet snapshots

Deferred | Remittances | Wallet | User Profile Sync | GK ID | Mobile

Before you start

- The customer has an existing remittance snapshot and wallet profile
- `EnableRemittanceUserProfileEventSync` is on
- A second email address not registered to another GKOne user

#	Do this	You should see	✓
1	Record `email` and `syncInfo` on the remittance snapshot, and `Email`, `LastEventId` and `LastSyncedAtUtc` on the wallet profile	—	☐
2	In the app, change the email address and verify the OTP sent to the new address	The change succeeds; the customer is signed out with the sign-in-required notice	☐
3	Allow propagation, then query the remittance snapshot	`email` = the new address; `syncInfo.lastAppliedEventId` has changed	☐
4	Query the wallet profile	`Email` = the new address; `LastEventId` and `LastSyncedAtUtc` have changed	☐

Afterwards

- No second profile document exists for the customer in either container

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 23 Verify that a remittance sent after an email change sends its confirmation to the new address only

Deferred | Remittances | User Profile Sync | Mobile | Regression

Before you start

- TC 22 has been completed for this customer

#	Do this	You should see	✓
1	Sign in with the new email address	Sign-in succeeds	☐
2	Send a WU Outbound remittance to completion	The transaction completes	☐
3	Check both mailboxes	The confirmation email arrives at the **new** address only	☐

Afterwards

- Nothing is sent to the old email address after the change

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 24 Verify that an OTP-verified phone number change updates the existing profile copies without creating a second record

Deferred | Remittances | Wallet | User Profile Sync | GK ID | Mobile

Before you start

- The customer has existing remittance and wallet profile documents
- `EnablePhoneNumberProfileMigration` is on in QA *(without it, an OTP phone change doesn't publish)*
- `EnableRemittanceUserProfileEventSync` is on

#	Do this	You should see	✓
1	Record each document's `id` and phone number	—	☐
2	In the app, complete the phone change journey (enter the new number, then the code sent to the customer's email)	The change succeeds	☐
3	Allow propagation, then query both containers by the customer's user ID	**One** document each; same `id` as step 1; phone = the new number	☐
4	Query both containers by the old phone number	No match	☐

Afterwards

- `profileId` on the User Profile record is unchanged *(still an open question)*

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

TC 25 Verify that a Reset KYC that is proposed but not approved doesn't change either profile copy

Deferred | Remittances | Wallet | User Profile Sync | KYC | Admin Portal

Before you start

- The customer is Tier 1 with both copies

#	Do this	You should see	✓
1	Record the KYC fields and sync metadata on both copies	—	☐
2	Propose a Reset KYC action and leave it pending	The action is shown as PENDING	☐
3	Query both copies	Unchanged	☐
4	As checker, reject the action, then query both copies again	Still unchanged	☐

Afterwards

- The customer remains Tier 1 everywhere

Result ☐ Pass ☐ Fail ☐ Blocked **Notes** _____

Things still to confirm

Open points that might change an expected result. Check these before raising a bug.

- **Entry points.** The app or portal entry points for TC 6, 7 and 11 aren't confirmed, and nobody has said whether the admin detail edit uses maker-checker.
- **Flags in QA.** The QA values of `EnablePhoneNumberProfileMigration` and `EnableIdentityConflictResolution` are unknown.
- **Remittance event sync is off in QA.** Every remittance-snapshot check after a change needs `EnableRemittanceUserProfileEventSync` turned on first. Coordinate this, because the subscription has a backlog that will start processing when it's turned on.
- **Expected gaps, from the review, to raise as defect candidates if confirmed:**
  - TC 3: `mothersMaidenName` doesn't propagate.
  - TC 11: employment status and mother's maiden name don't propagate.
  - TC 6: proof-of-address validity isn't refreshed by events.
